Our activities in the field of electronics:

- we focus on small, operationally complex devices
- for examples see: [TECHNICAL INFO](#) (for now them only in finnish but will later come out in English)
- innovation of new products
- developement of products to client

We are looking for partnership to our products

- a sponsor, partner, or a client to buy all rights to a product
- sales by client, manufactured by us
- to client made product development
- and other co-operatings...

Our products are based on the use of a microcontroller (processor) ST62xx.

We have our own products developed with a variety of interfaces,
(interface = environmental $\leftarrow \rightarrow$ processor), see [TECHNICAL INFO](#) , these can be used in the most variety of applications.

We also have many software routines (developed by ourselves), which can be applied and/or modified to meet the clients requirements.

We have a variety of circuitboards containing the necessary components: processor, relays, switches for programming, LED displays etc.

Many of the circuitboards are rated to DIN-standard housing,
so the: manufacturer to product development time and cost savings can be substantial.
